Sparse Learning for Noise Data Detection

Examples of Noisy Data/Outliers

Outliers are the irregular data compared with the majority of the dataset.

Complex/Confusing items identified

Identify Noisy Data in Label Space

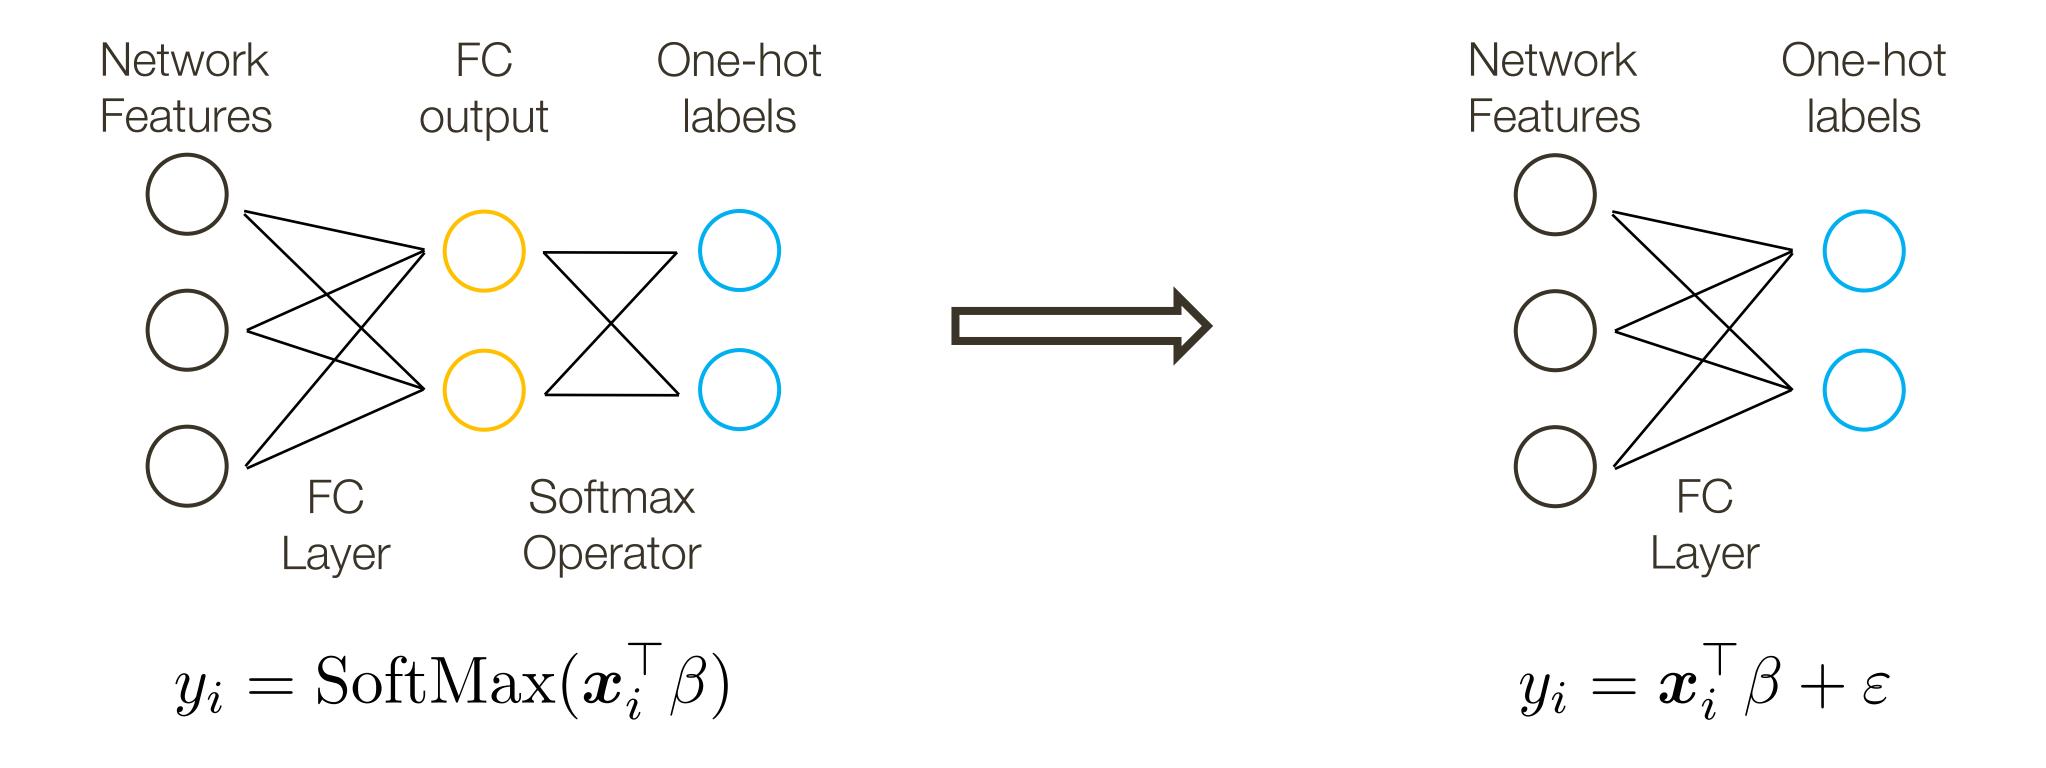

Noisy One-hot Labels Deep Features
$$Y = X\beta$$

$$Y \in \mathbb{R}^{n \times c} \quad X \in \mathbb{R}^{n \times d} \quad \beta \in \mathbb{R}^{d \times c}$$

$$\beta \text{ is sensitive to noisy data!}$$

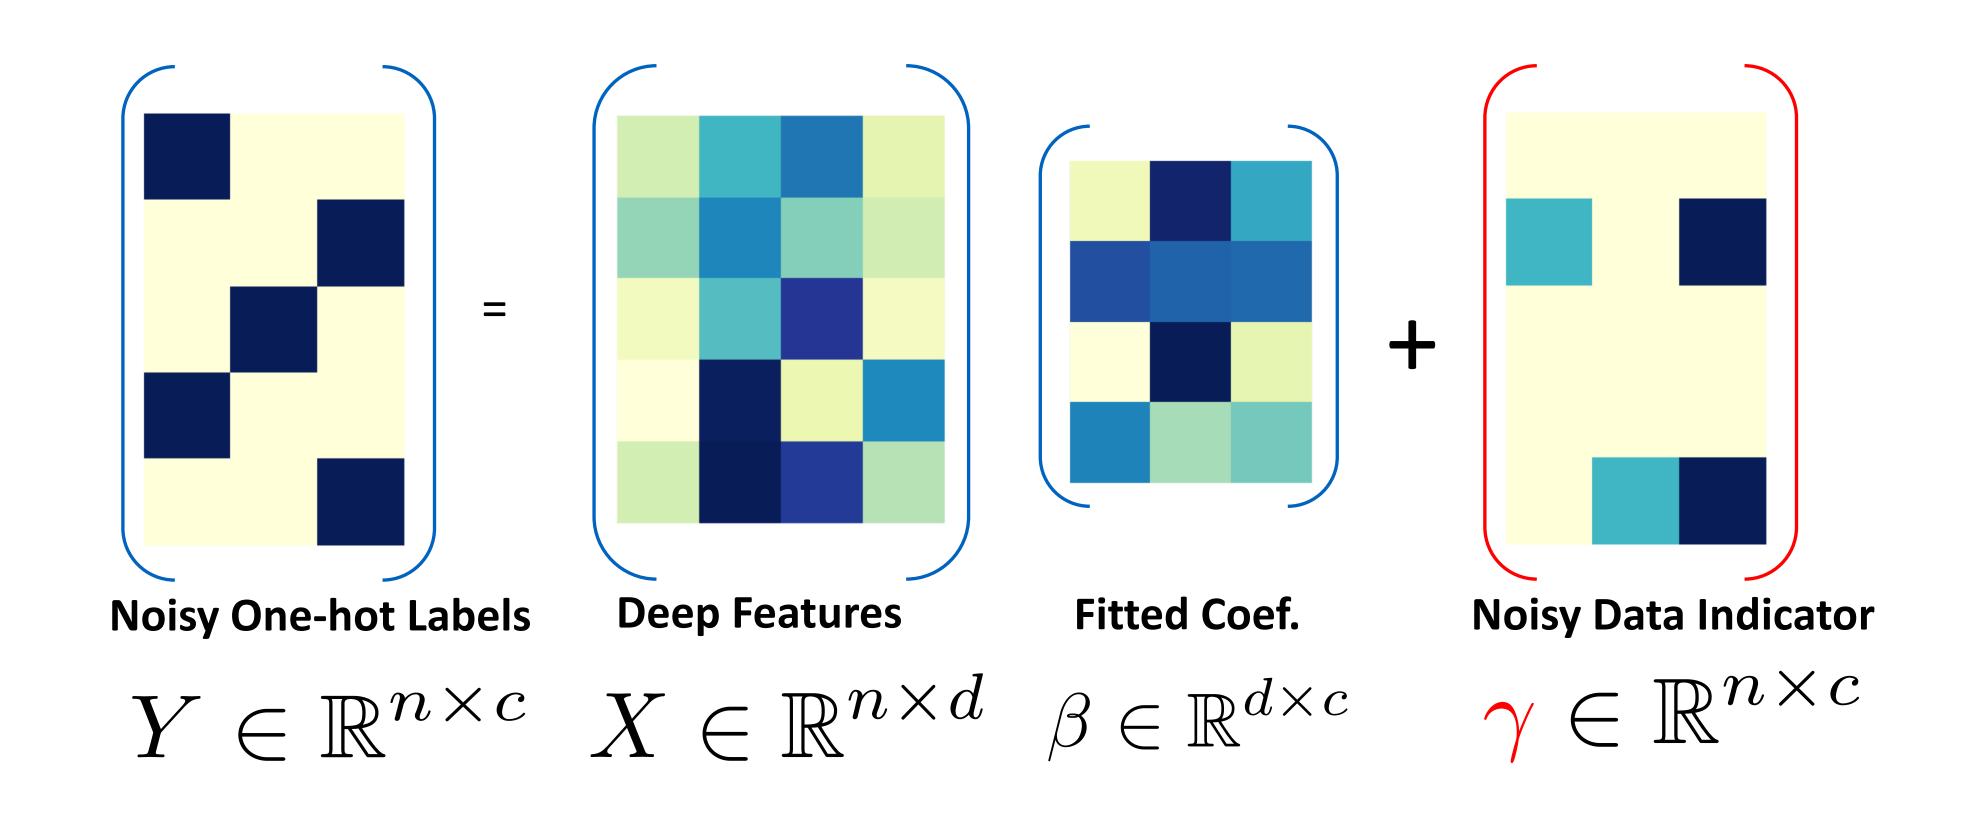

Approximated Linear Assumption in Networks

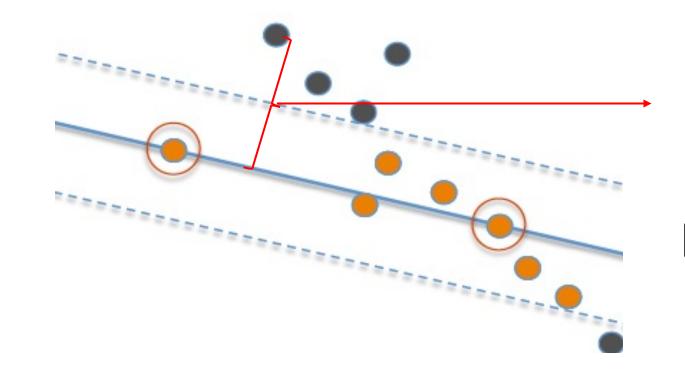

Identify Noisy Data in Label Space: The Indicator

Linear system
$$Y=X\beta+\gamma$$
 with Noisy Data/Labels

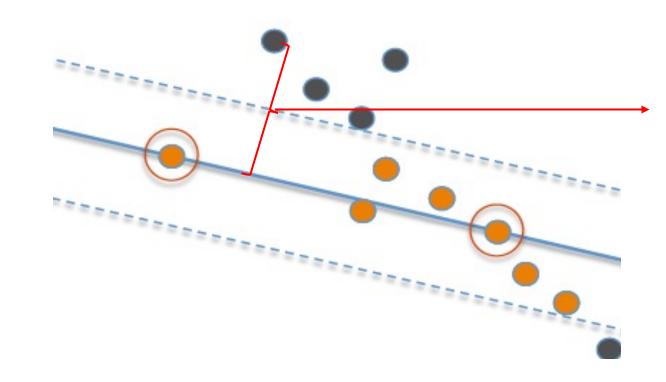

$$y = x^{\top} \beta + \varepsilon + \gamma$$

 γ_i equals to the residual predict error $\gamma_i = y_i - x_i^{\top} \hat{\beta}$

Row residuals fail to detect outliers at leverage points.

$$y = x^{\top} \beta + \varepsilon + \gamma$$

 γ_i equals to the residual predict error $\gamma_i = y_i - x_i^{\top} \hat{\beta}$

Leave-one-out externally studentized residual:

$$t_i = \frac{y_i - \boldsymbol{x}_i^{\top} \hat{\beta}_{(i)}}{\hat{\sigma}_{(i)} (1 + \boldsymbol{x}_i (\boldsymbol{X}_{(i)}^{\top} \boldsymbol{X}_{(i)})^{-1} \boldsymbol{x}_i)^{1/2}}$$

 \Leftrightarrow test whether $\gamma = 0$ in $\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \gamma \mathbf{1}_i + \boldsymbol{\varepsilon}$.

$$y = x^{\top} \beta + \varepsilon + \gamma$$

 γ_i equals to the residual predict error $\gamma_i = y_i - x_i^{\top} \hat{\beta}$

Leave-one-out externally studentized residual:

$$t_i = rac{y_i - m{x}_i^{ op} \hat{eta}_{(i)}}{\hat{\sigma}_{(i)} (1 + m{x}_i (m{X}_{(i)}^{ op} m{X}_{(i)})^{-1} m{x}_i)^{1/2}}$$

 \Leftrightarrow test whether $\gamma = 0$ in $\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \gamma \mathbf{1}_i + \boldsymbol{\varepsilon}$.

When there are multiple outliers:

- 1. masking: multiple outliers may mask each other and being undetected;
- 2. swamping: multiple outliers may lead the large t_i for clean data.

$$y = x^{\top} \beta + \varepsilon + \gamma$$

 γ_i equals to the residual predict error $\gamma_i = y_i - x_i^{\top} \hat{\beta}$

Leave-one-out externally studentized residual:

$$t_i = rac{y_i - m{x}_i^{ op} \hat{eta}_{(i)}}{\hat{\sigma}_{(i)} (1 + m{x}_i (m{X}_{(i)}^{ op} m{X}_{(i)})^{-1} m{x}_i)^{1/2}}$$

 \Leftrightarrow test whether $\gamma = 0$ in $\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \gamma \mathbf{1}_i + \boldsymbol{\varepsilon}$.

$$oldsymbol{y} = oldsymbol{X}eta + oldsymbol{\epsilon} + oldsymbol{\gamma}$$

Identify Noisy Data in the Dataset

$$y_i = x_i^{\top} \beta + \varepsilon + \gamma_i \qquad \qquad \qquad \hat{\gamma}_i \qquad \qquad O = \{i : \hat{\gamma}_i \neq 0\}$$

$$\underset{\boldsymbol{\beta},\boldsymbol{\gamma}}{\operatorname{argmin}} L\left(\boldsymbol{\beta},\boldsymbol{\gamma}\right) \coloneqq \|\boldsymbol{Y} - \boldsymbol{X}\boldsymbol{\beta} - \boldsymbol{\gamma}\|_{F}^{2} + \lambda R\left(\boldsymbol{\gamma}\right)$$

Simplification

$$\underset{\boldsymbol{\beta}, \boldsymbol{\gamma}}{\operatorname{argmin}} L \left(\boldsymbol{\beta}, \boldsymbol{\gamma} \right) \coloneqq \left\| \boldsymbol{Y} - \boldsymbol{X} \boldsymbol{\beta} - \boldsymbol{\gamma} \right\|_{\mathrm{F}}^{2} + \lambda R \left(\boldsymbol{\gamma} \right)$$

$$\frac{\partial L}{\partial \beta} = 0 \quad \middle| \quad \hat{\boldsymbol{\beta}} = (\boldsymbol{X}^{\top} \boldsymbol{X})^{\dagger} \boldsymbol{X}^{\top} (\boldsymbol{Y} - \boldsymbol{\gamma})$$

$$\operatorname{argmin} \left\| \boldsymbol{Y} - \boldsymbol{X} \left(\boldsymbol{X}^{\top} \boldsymbol{X} \right)^{\dagger} \boldsymbol{X}^{\top} (\boldsymbol{Y} - \boldsymbol{\gamma}) - \boldsymbol{\gamma} \right\|_{\mathrm{F}}^{2} + \lambda R \left(\boldsymbol{\gamma} \right)$$

$$H = \boldsymbol{X} \left(\boldsymbol{X}^{\top} \boldsymbol{X} \right)^{\dagger} \boldsymbol{X}^{\top} \quad \middle| \quad \tilde{\boldsymbol{X}} = \boldsymbol{I} - \boldsymbol{H}, \tilde{\boldsymbol{Y}} = \tilde{\boldsymbol{X}} \boldsymbol{Y}$$

$$\operatorname{argmin} \left\| \tilde{\boldsymbol{Y}} - \tilde{\boldsymbol{X}} \boldsymbol{\gamma} \right\|_{\mathrm{F}}^{2} + \lambda R \left(\boldsymbol{\gamma} \right)$$

A linear regression problem!

Wang et al. How to Trust Unlabeled Data? Instance Credibility Inference for Few-Shot Learning. IEEE TPAMI 2021.

Wang et al. Scalable Penalized Regression for Noise Detection in Learning with Noisy Labels. CVPR 2022.

Solving Gamma in Linear Regression

$$\underset{\boldsymbol{\gamma}}{\operatorname{argmin}} \left\| \tilde{\boldsymbol{Y}} - \tilde{\boldsymbol{X}} \boldsymbol{\gamma} \right\|_{\mathrm{F}}^{2} + \lambda R \left(\boldsymbol{\gamma} \right)$$

How to select λ ?

We regard $\hat{\gamma} = f(\lambda)$.

- heuristics rules $\lambda = 2.5\hat{\sigma}$?
 - ricaristics raics $\pi = 2.50$.
- Cross-validation?
- Data adaptive techniques?
- AIC, BIC?

It is hard to select a proper λ .

When
$$\lambda \to \infty$$
, $\hat{\gamma} \to 0$.

With
$$R(\gamma) = \sum_{i=1}^{n} ||\gamma_i||_2$$
, γ vanishes instance by instance.

$$C_i = \sup\{\lambda : \|\hat{\gamma}_i(\lambda)\| \neq 0\}$$

This can be sovled by GLMnet[1].

Solving Gamma in Linear Regression

$$\underset{\boldsymbol{\gamma}}{\operatorname{argmin}} \left\| \tilde{\boldsymbol{Y}} - \tilde{\boldsymbol{X}} \boldsymbol{\gamma} \right\|_{\mathrm{F}}^{2} + \lambda R \left(\boldsymbol{\gamma} \right)$$

When
$$\lambda \to \infty$$
, $\hat{\gamma} \to 0$.

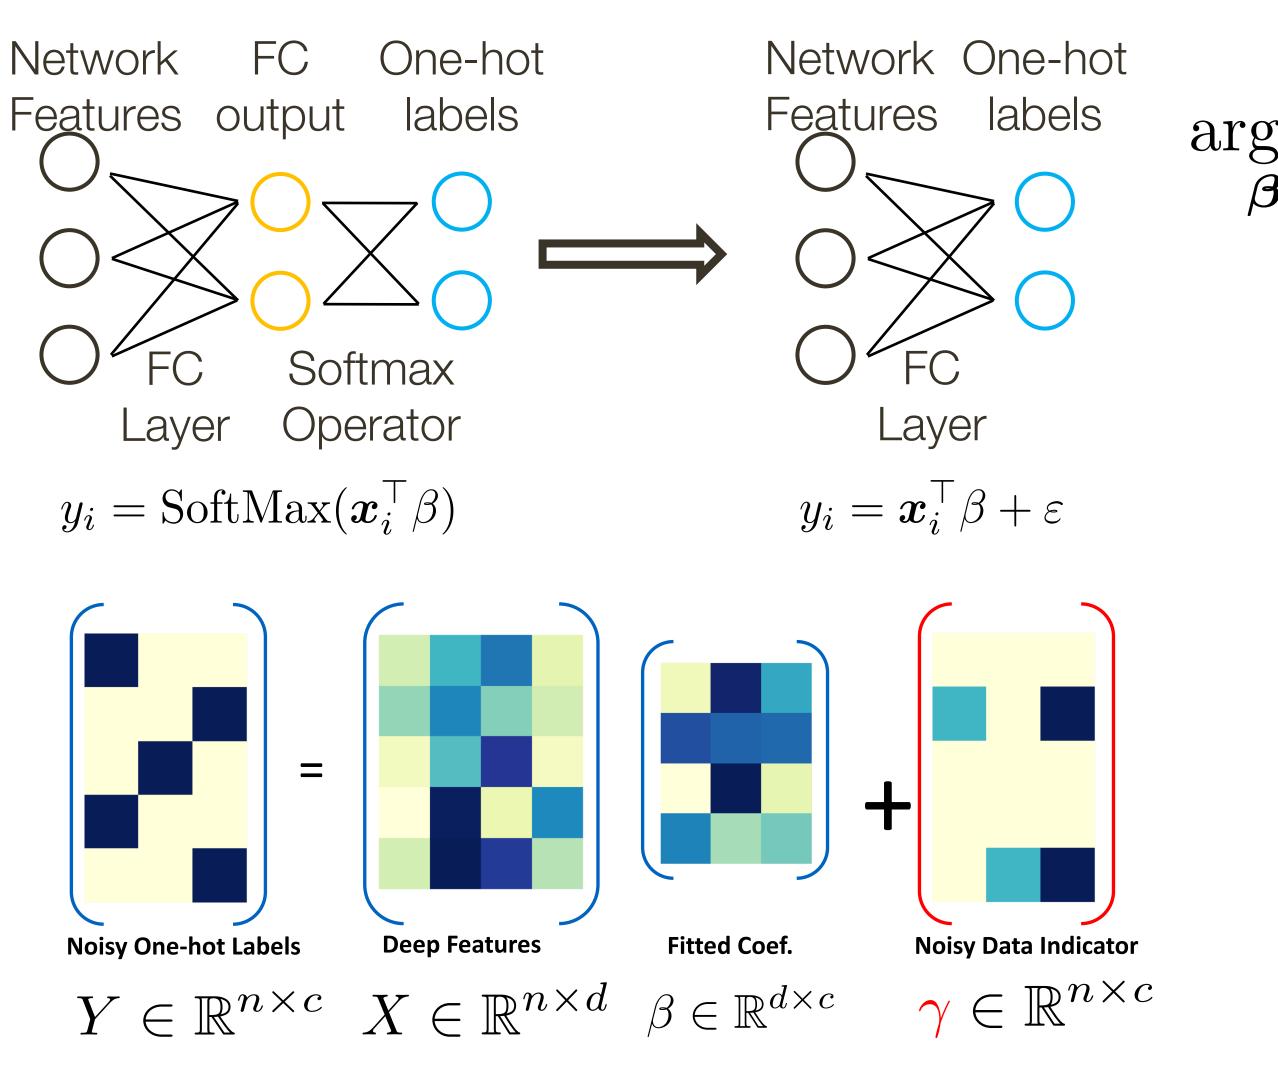

With
$$R(\gamma) = \sum_{i=1}^{n} ||\gamma_i||_2$$
, γ vanishes instance by instance.

$$C_i = \sup\{\lambda : \|\hat{\gamma}_i(\lambda)\| \neq 0\}$$

This can be sovled by GLMnet[1].

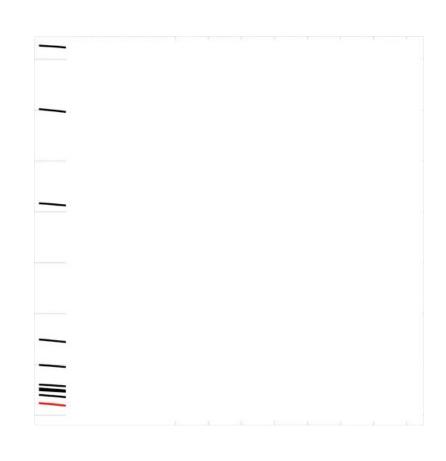

Instance Credibility Inference

$$\underset{\boldsymbol{\beta}, \boldsymbol{\gamma}}{\operatorname{argmin}} L\left(\boldsymbol{\beta}, \boldsymbol{\gamma}\right) \coloneqq \left\|\boldsymbol{Y} - \boldsymbol{X}\boldsymbol{\beta} - \boldsymbol{\gamma}\right\|_{\mathrm{F}}^{2} + \lambda R\left(\boldsymbol{\gamma}\right)$$

$$\underset{\boldsymbol{\gamma}}{\operatorname{argmin}} \left\|\tilde{\boldsymbol{Y}} - \tilde{\boldsymbol{X}}\boldsymbol{\gamma}\right\|_{\mathrm{F}}^{2} + \lambda R\left(\boldsymbol{\gamma}\right)$$

$$C_i = \sup\{\lambda : \|\hat{\gamma}_i(\lambda)\| \neq 0\}$$

Noise Set Recovery

When will the model identify all the outliers?

Assume ε is i.i.d zero-mean sub-Gaussian noise. We give three conditions:

• (C1: Restricted eigenvalue)

$$\lambda_{\min} \left(\tilde{\boldsymbol{U}}_{S}^{\top} \tilde{\boldsymbol{U}}_{S} \right) = C_{\min} > 0.$$

• (C2: Irrepresentability) $\exists \eta \in (0,1]$,

$$\left\| ilde{m{U}}_{S^c}^ op ilde{m{U}}_S \left(ilde{m{U}}_S^ op ilde{m{U}}_S
ight)^{-1}
ight\|_{\infty} \leq 1 - \eta.$$

• (C3: Large error)

$$\vec{\gamma}_{\min} \coloneqq \min_{i \in S} |\vec{\gamma}^*| > h\left(\lambda, \eta, \tilde{U}, \vec{\gamma}^*\right).$$

A non-asymptotic probabilistic result

Based on these conditions, we could provide the following theorem:

Theorem 1 (Identifiability of ICI). Let $\lambda \geq \frac{2\sigma\sqrt{\mu_{\tilde{U}}}}{\eta}\sqrt{\log cn}$. Then with probability greater than $1-2(cn)^{-1}$, the problem has a unique solution $\hat{\gamma}$ satisfies the following properties:

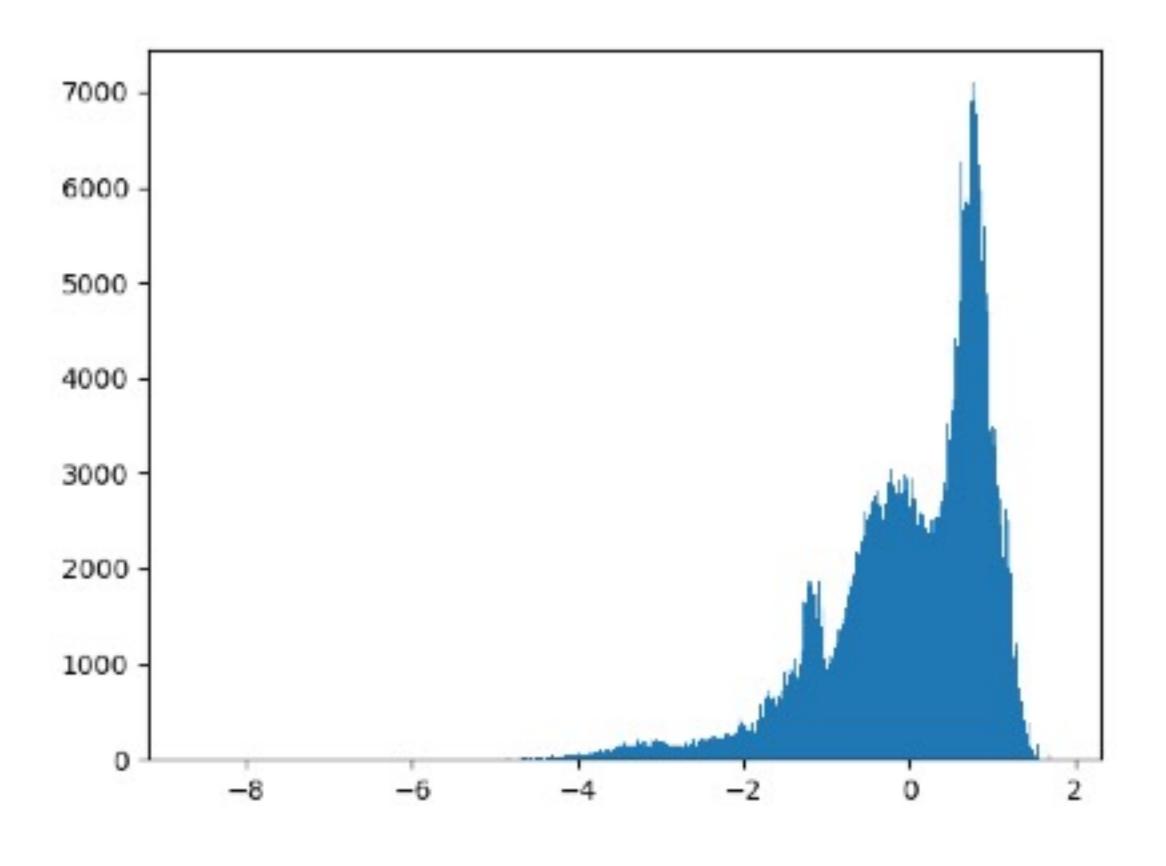

1) If C1 and C2 hold, the wrong-predicted instances indicated by ICI has no false positive error, i.e., $\hat{S} \subseteq S$ and hence $\hat{O} \subseteq O$, and

$$\left\|\hat{\vec{\gamma}}_S - \vec{\gamma}_S^*\right\|_{\infty} \le h\left(\lambda, \eta, \tilde{U}, \tilde{\gamma}^*\right);$$

2) If C1, C2, and C3 hold, ICI will identify all the correctly-predicted instance, i.e., $\hat{S} = S$ and hence $\hat{O} = O$ (in fact sign $(\hat{\vec{\gamma}}) = \text{sign}(\vec{\gamma}^*)$).

Identifiability in reality: sub-Gaussian noise

$$\mathbb{E}\left[\hat{\varepsilon}\right] \approx 10^{-19}$$

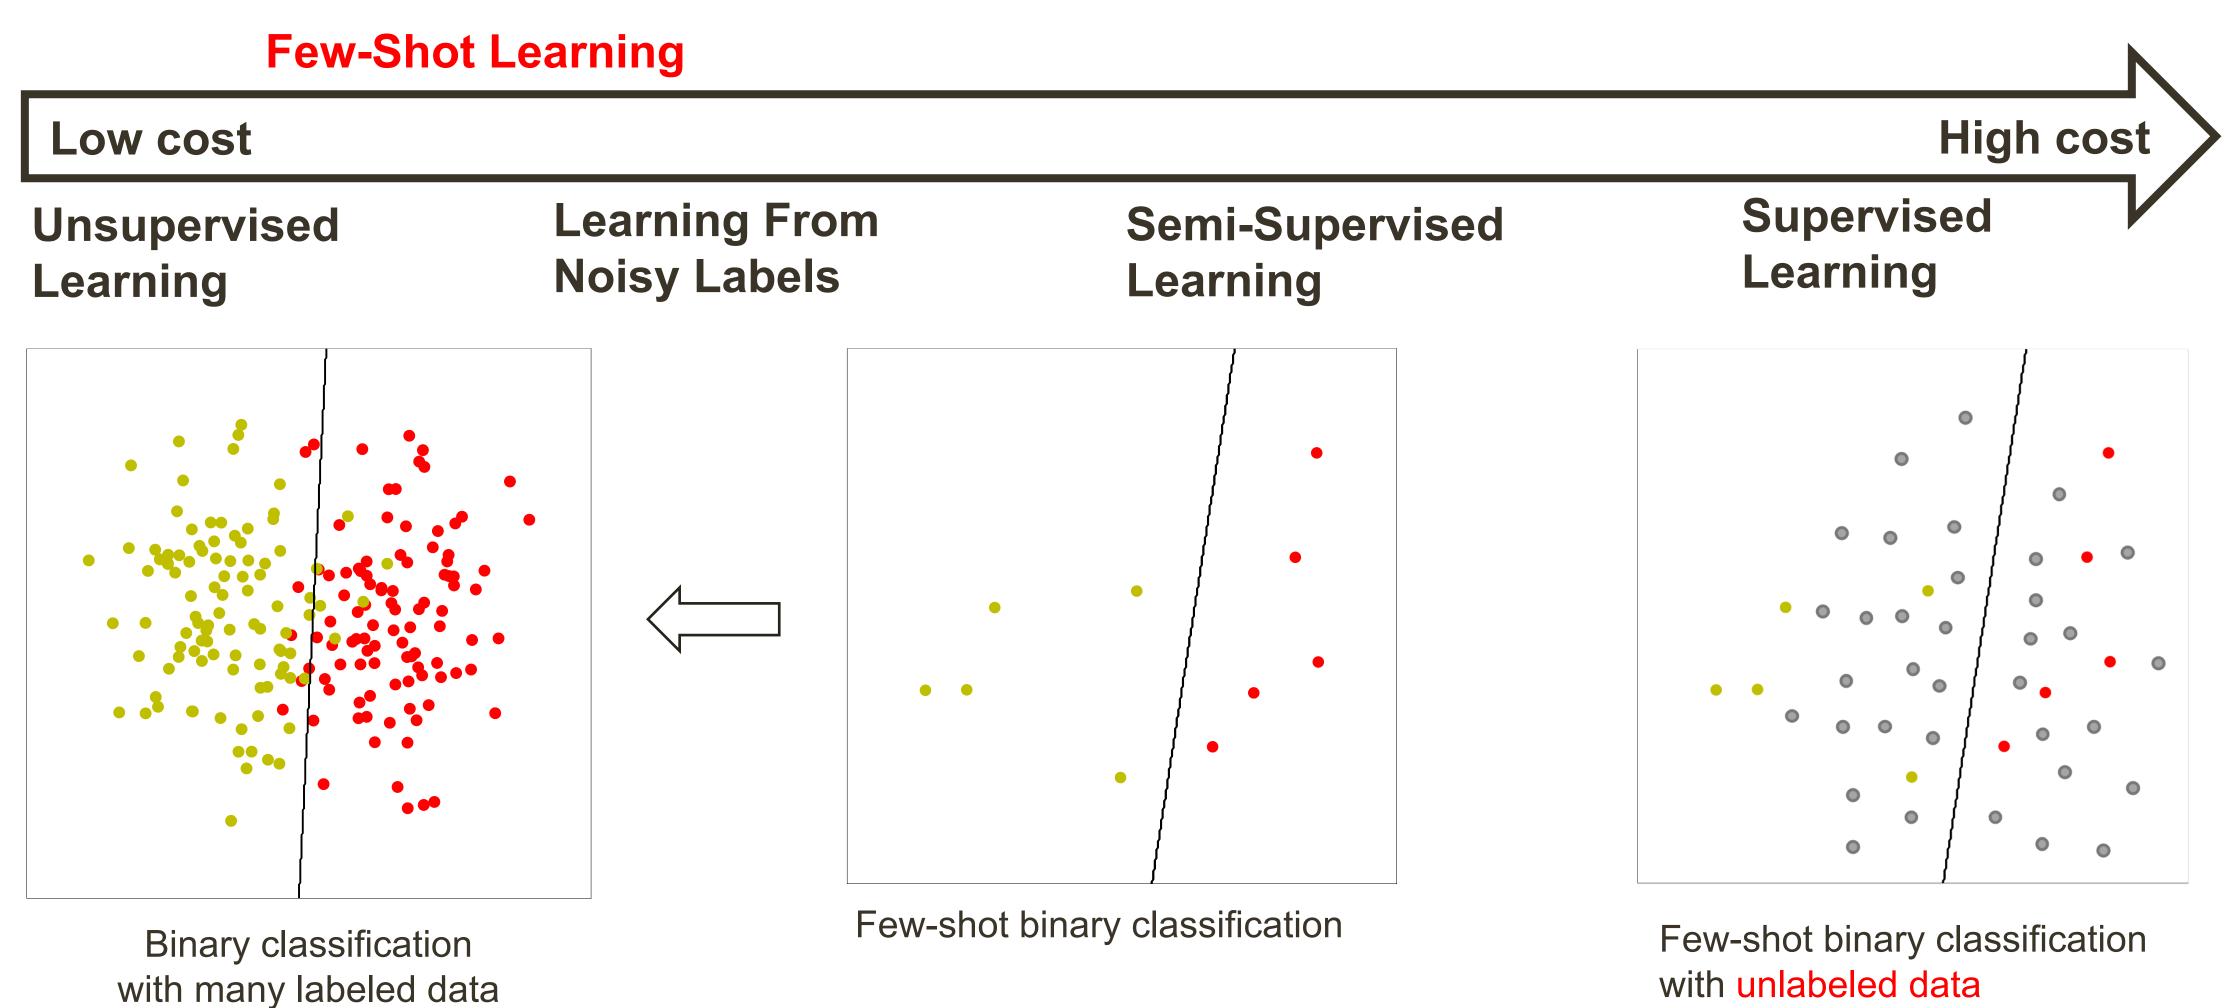

$$\operatorname{Var}\left[\hat{\varepsilon}\right] \approx 0.99$$

Sparse Learning in Few-Shot Learning

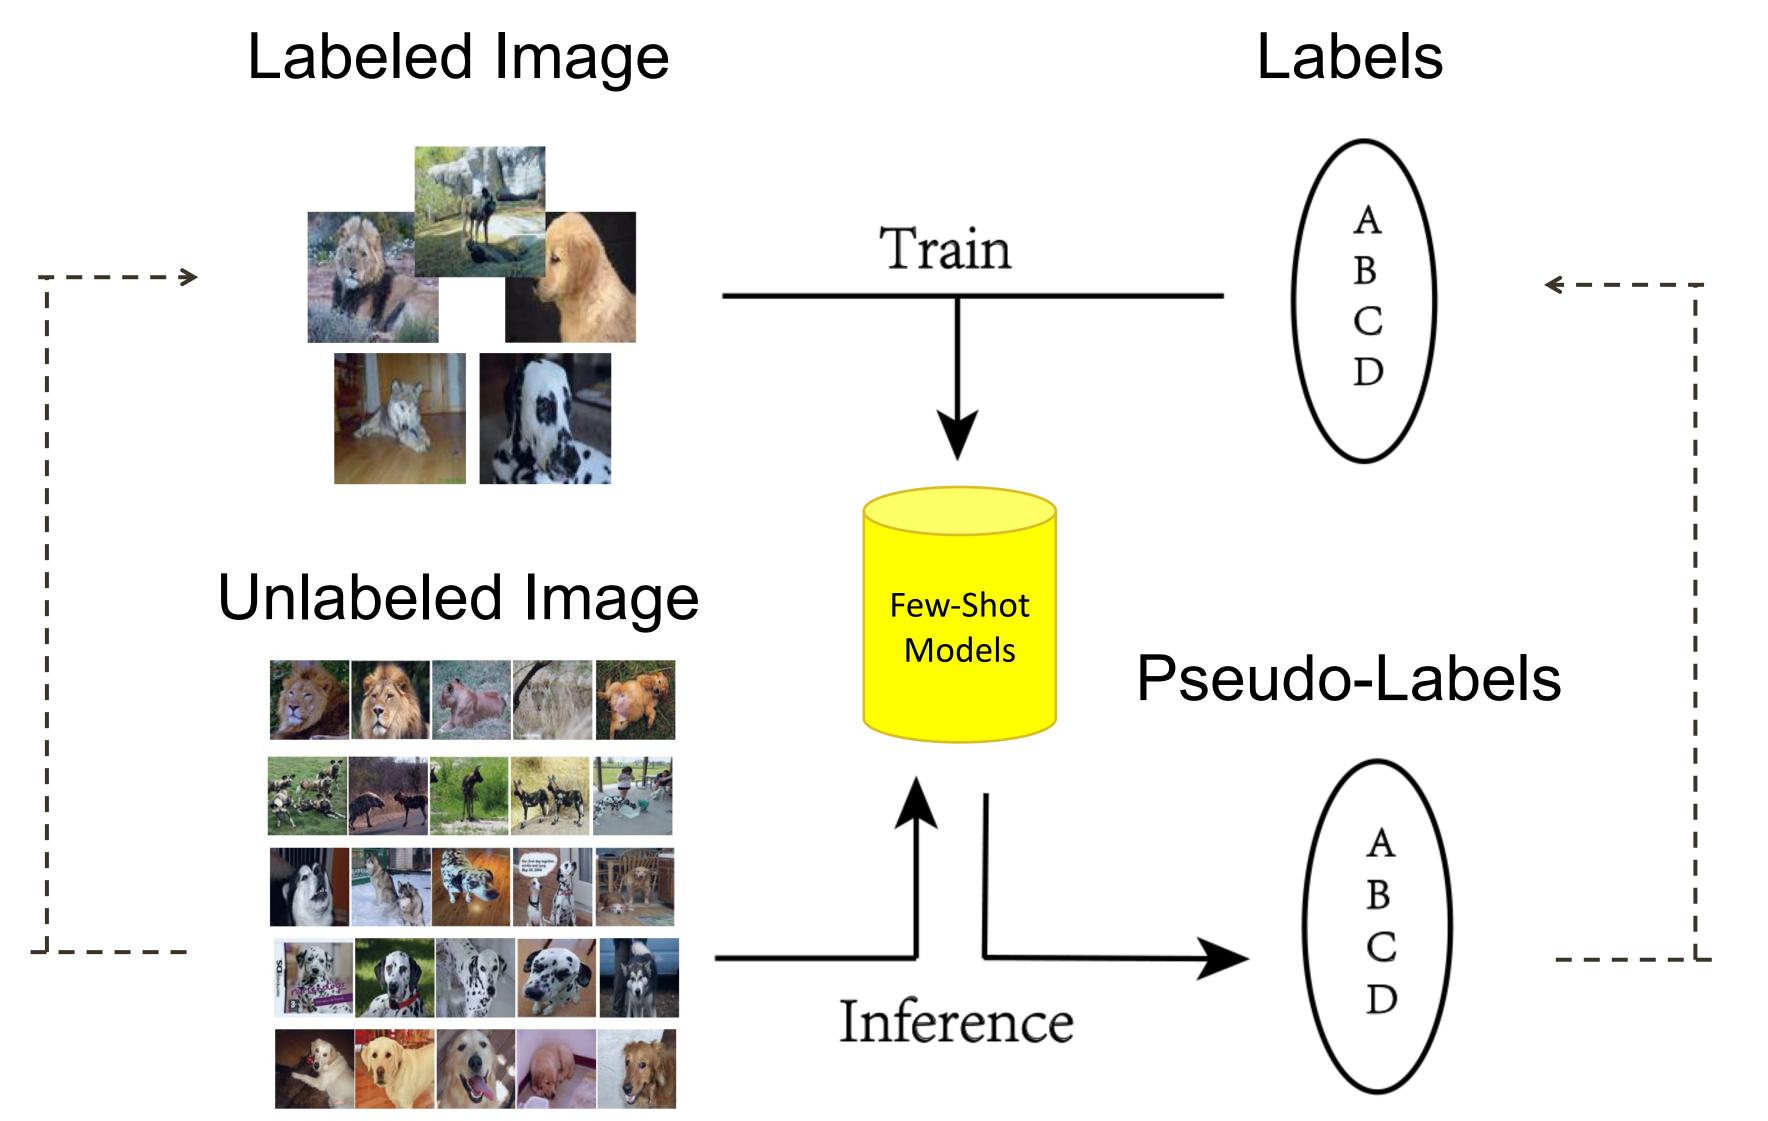

Definition of Few-Shot Learning

Tackle machine learning problem with only limited training data provided.

Motivation

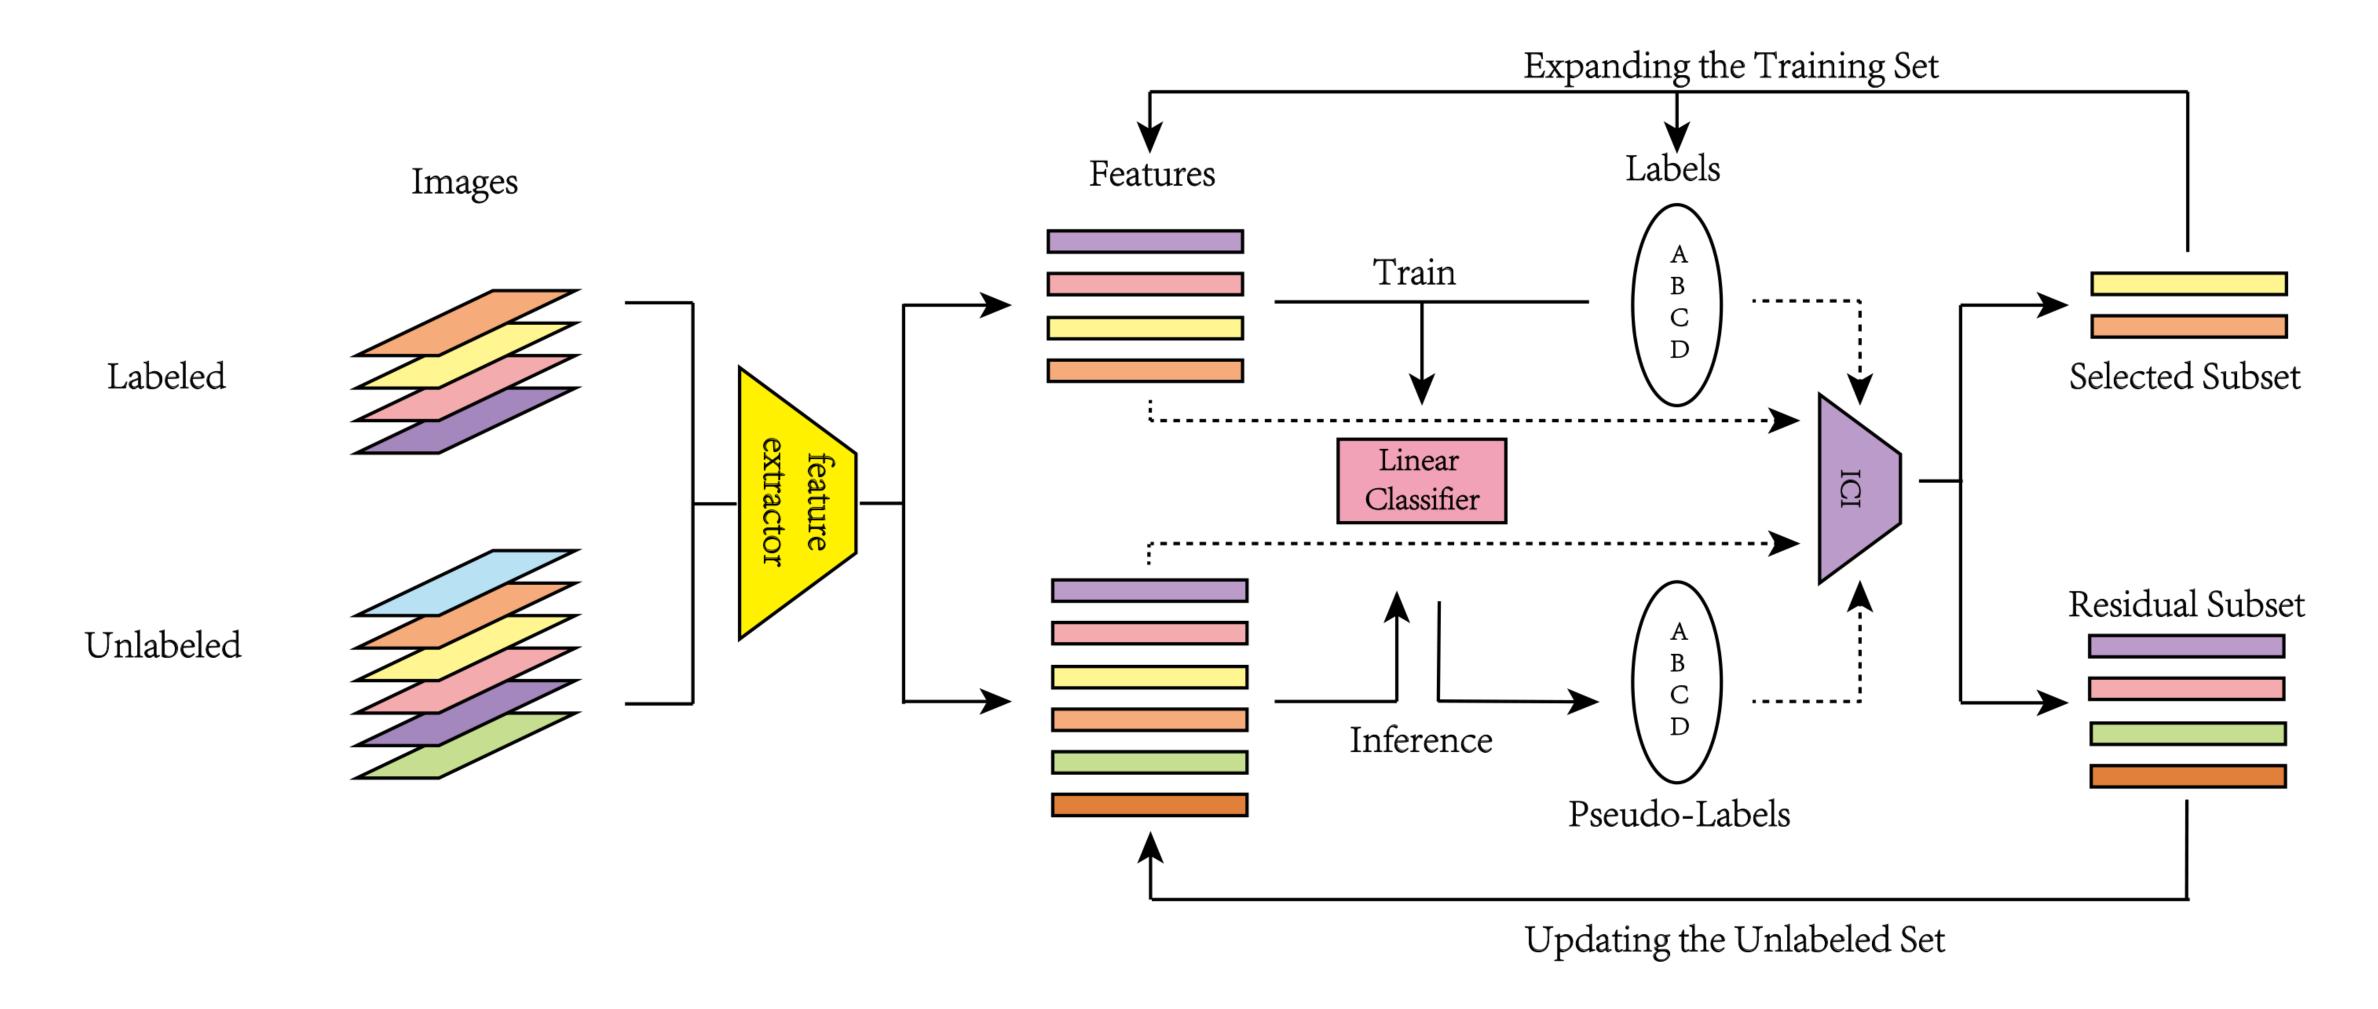

Wang et al. How to Trust Unlabeled Data? Instance Credibility Inference for Few-Shot Learning. IEEE TPAMI 2021

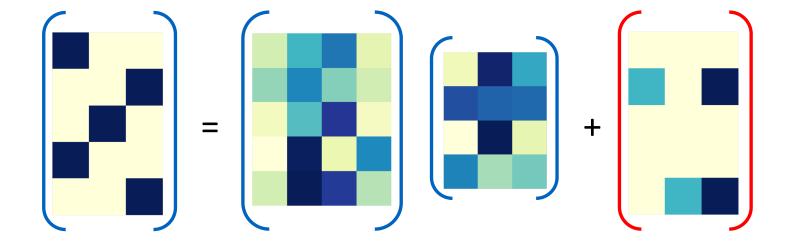

Framework

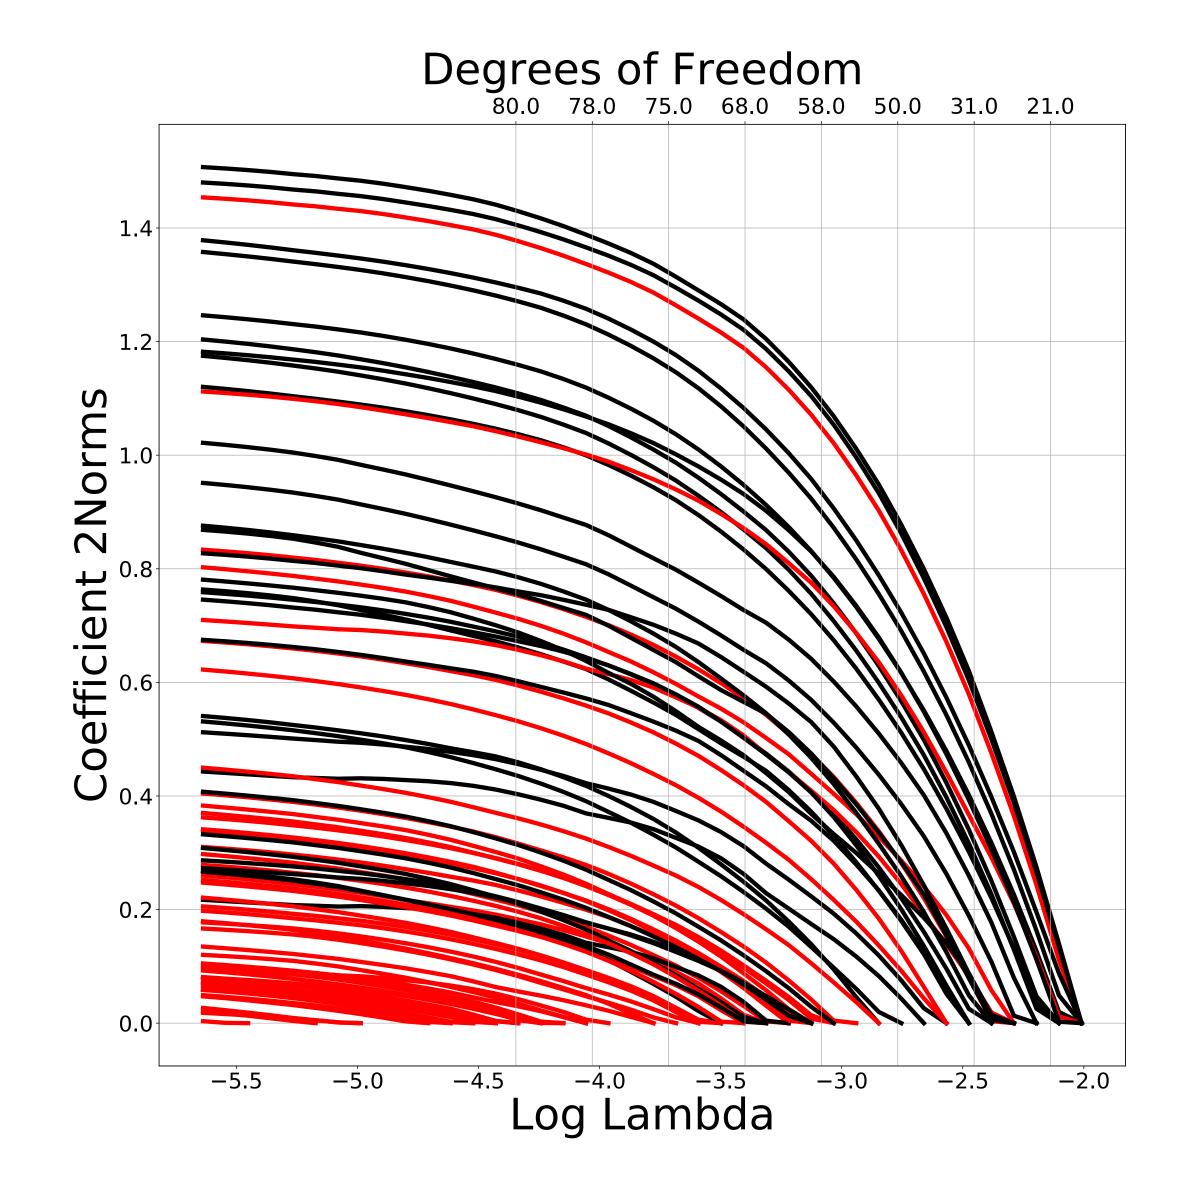

Sparse Learning in ICI

$$y_i = x_i^{\top} \beta + \varepsilon + \gamma_i$$

$$\underset{\boldsymbol{\beta},\boldsymbol{\gamma}}{\operatorname{argmin}} L\left(\boldsymbol{\beta},\boldsymbol{\gamma}\right) \coloneqq \left\|\boldsymbol{Y} - \boldsymbol{X}\boldsymbol{\beta} - \boldsymbol{\gamma}\right\|_{\mathrm{F}}^{2} + \lambda R\left(\boldsymbol{\gamma}\right)$$

$$\underset{\boldsymbol{\gamma}}{\operatorname{argmin}} \left\| \tilde{\boldsymbol{Y}} - \tilde{\boldsymbol{X}} \boldsymbol{\gamma} \right\|_{\mathrm{F}}^{2} + \lambda R \left(\boldsymbol{\gamma} \right)$$

Sparse Learning: Extend to Logistic Regression

$$\underset{\boldsymbol{\beta}, \boldsymbol{\gamma}}{\operatorname{argmin}} L\left(\boldsymbol{\beta}, \boldsymbol{\gamma}\right) \coloneqq \left\|\boldsymbol{Y} - \boldsymbol{X}\boldsymbol{\beta} - \boldsymbol{\gamma}\right\|_{\mathrm{F}}^{2} + \lambda R\left(\boldsymbol{\gamma}\right) \qquad \qquad \boldsymbol{Y}_{i,c} = \frac{\exp\left(\boldsymbol{X}_{i,\cdot}\boldsymbol{\beta}_{\cdot,c} + \boldsymbol{\gamma}_{i,c}\right)}{\sum_{l=1}^{C} \exp\left(\boldsymbol{X}_{i,\cdot}\boldsymbol{\beta}_{\cdot,l} + \boldsymbol{\gamma}_{i,l}\right)} + \boldsymbol{\varepsilon}_{i,c}$$

$$\underset{\boldsymbol{\gamma}}{\operatorname{argmin}} \left\|\boldsymbol{Y} - \boldsymbol{X}\left(\boldsymbol{X}^{\top}\boldsymbol{X}\right)^{\dagger} \boldsymbol{X}^{\top} \left(\boldsymbol{Y} - \boldsymbol{\gamma}\right) - \boldsymbol{\gamma}\right\|_{\mathrm{F}}^{2} + \lambda R\left(\boldsymbol{\gamma}\right) \qquad \qquad \boldsymbol{\bar{X}} = \left(\boldsymbol{X}, \boldsymbol{I}\right) \qquad \boldsymbol{\bar{\beta}} = (\boldsymbol{\beta}, \boldsymbol{\gamma})^{\top}$$

$$\underset{\boldsymbol{\gamma}}{\operatorname{argmin}} \left\|\tilde{\boldsymbol{Y}} - \tilde{\boldsymbol{X}}\boldsymbol{\gamma}\right\|_{\mathrm{F}}^{2} + \lambda R\left(\boldsymbol{\gamma}\right) \qquad \qquad \boldsymbol{Y}_{i,c} = \frac{\exp\left(\boldsymbol{\bar{X}}_{i,\cdot}\boldsymbol{\bar{\beta}}_{\cdot,c}\right)}{\sum_{l=1}^{C} \exp\left(\boldsymbol{\bar{X}}_{i,\cdot}\boldsymbol{\bar{\beta}}_{\cdot,c}\right)} + \boldsymbol{\varepsilon}_{i,c}$$

$$oldsymbol{Y}_{i,c} = rac{\exp{(oldsymbol{X}_{i,.}oldsymbol{eta}_{.,c} + oldsymbol{\gamma_{i,c}})}}{\sum_{l=1}^{C}\exp{(oldsymbol{X}_{i,.}oldsymbol{eta}_{.,l} + oldsymbol{\gamma_{i,l}})}} + oldsymbol{arepsilon_{i,c}}$$
 $ar{oldsymbol{ar{x}}} = (oldsymbol{X}, oldsymbol{I})$ $ar{ar{eta}} = (oldsymbol{eta}, oldsymbol{\gamma})^{ op}$

$$oldsymbol{Y}_{i,c} = rac{\exp\left(oldsymbol{ar{X}}_{i,.}oldsymbol{ar{eta}}_{.,c}
ight)}{\sum_{l=1}^{C}\exp\left(oldsymbol{ar{X}}_{i,.}oldsymbol{ar{eta}}_{.,l}
ight)} + oldsymbol{arepsilon}_{i,c}$$

Identifiability in Reality: Conditions and Accuracy

Satisfied Assumptions	None	C1	C1 and C2	All
Improved Episodes Total Episodes I/T	0	$424 \\ 793 \\ 53.5\%$	$1035 \\ 1164 \\ 88.9\%$	$40 \\ 43 \\ 93.0\%$

1) In more than half of the experiments the assumptions C1-C2 are satisfied. Most of them (89.0%) will achieve better performance after self-taught with ICI.

Identifiability in Reality: Conditions and Accuracy

Satisfied Assumptions	None	C1	C1 and C2	All
Improved Episodes Total Episodes I/T	0	$424 \\ 793 \\ 53.5\%$	$1035 \\ 1164 \\ 88.9\%$	$40 \\ 43 \\ 93.0\%$

2) When all the assumptions are satisfied, we will get better performance in a high ratio (93.0%).

Identifiability in Reality: Conditions and Accuracy

Satisfied Assumptions	None	C1	C1 and C2	All
Improved Episodes Total Episodes I/T	0 0	$424 \\ 793 \\ 53.5\%$	$1035 \\ 1164 \\ 88.9\%$	$40 \\ 43 \\ 93.0\%$

3) Even if C2-C3 are not satisfied, we still have the chance of improving the performance (53.5%).

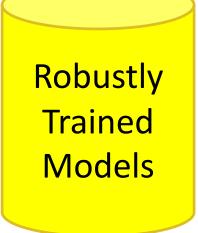

Sparse Learning

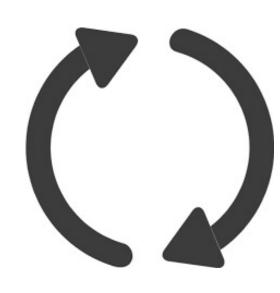

Definition of learning with noisy labels

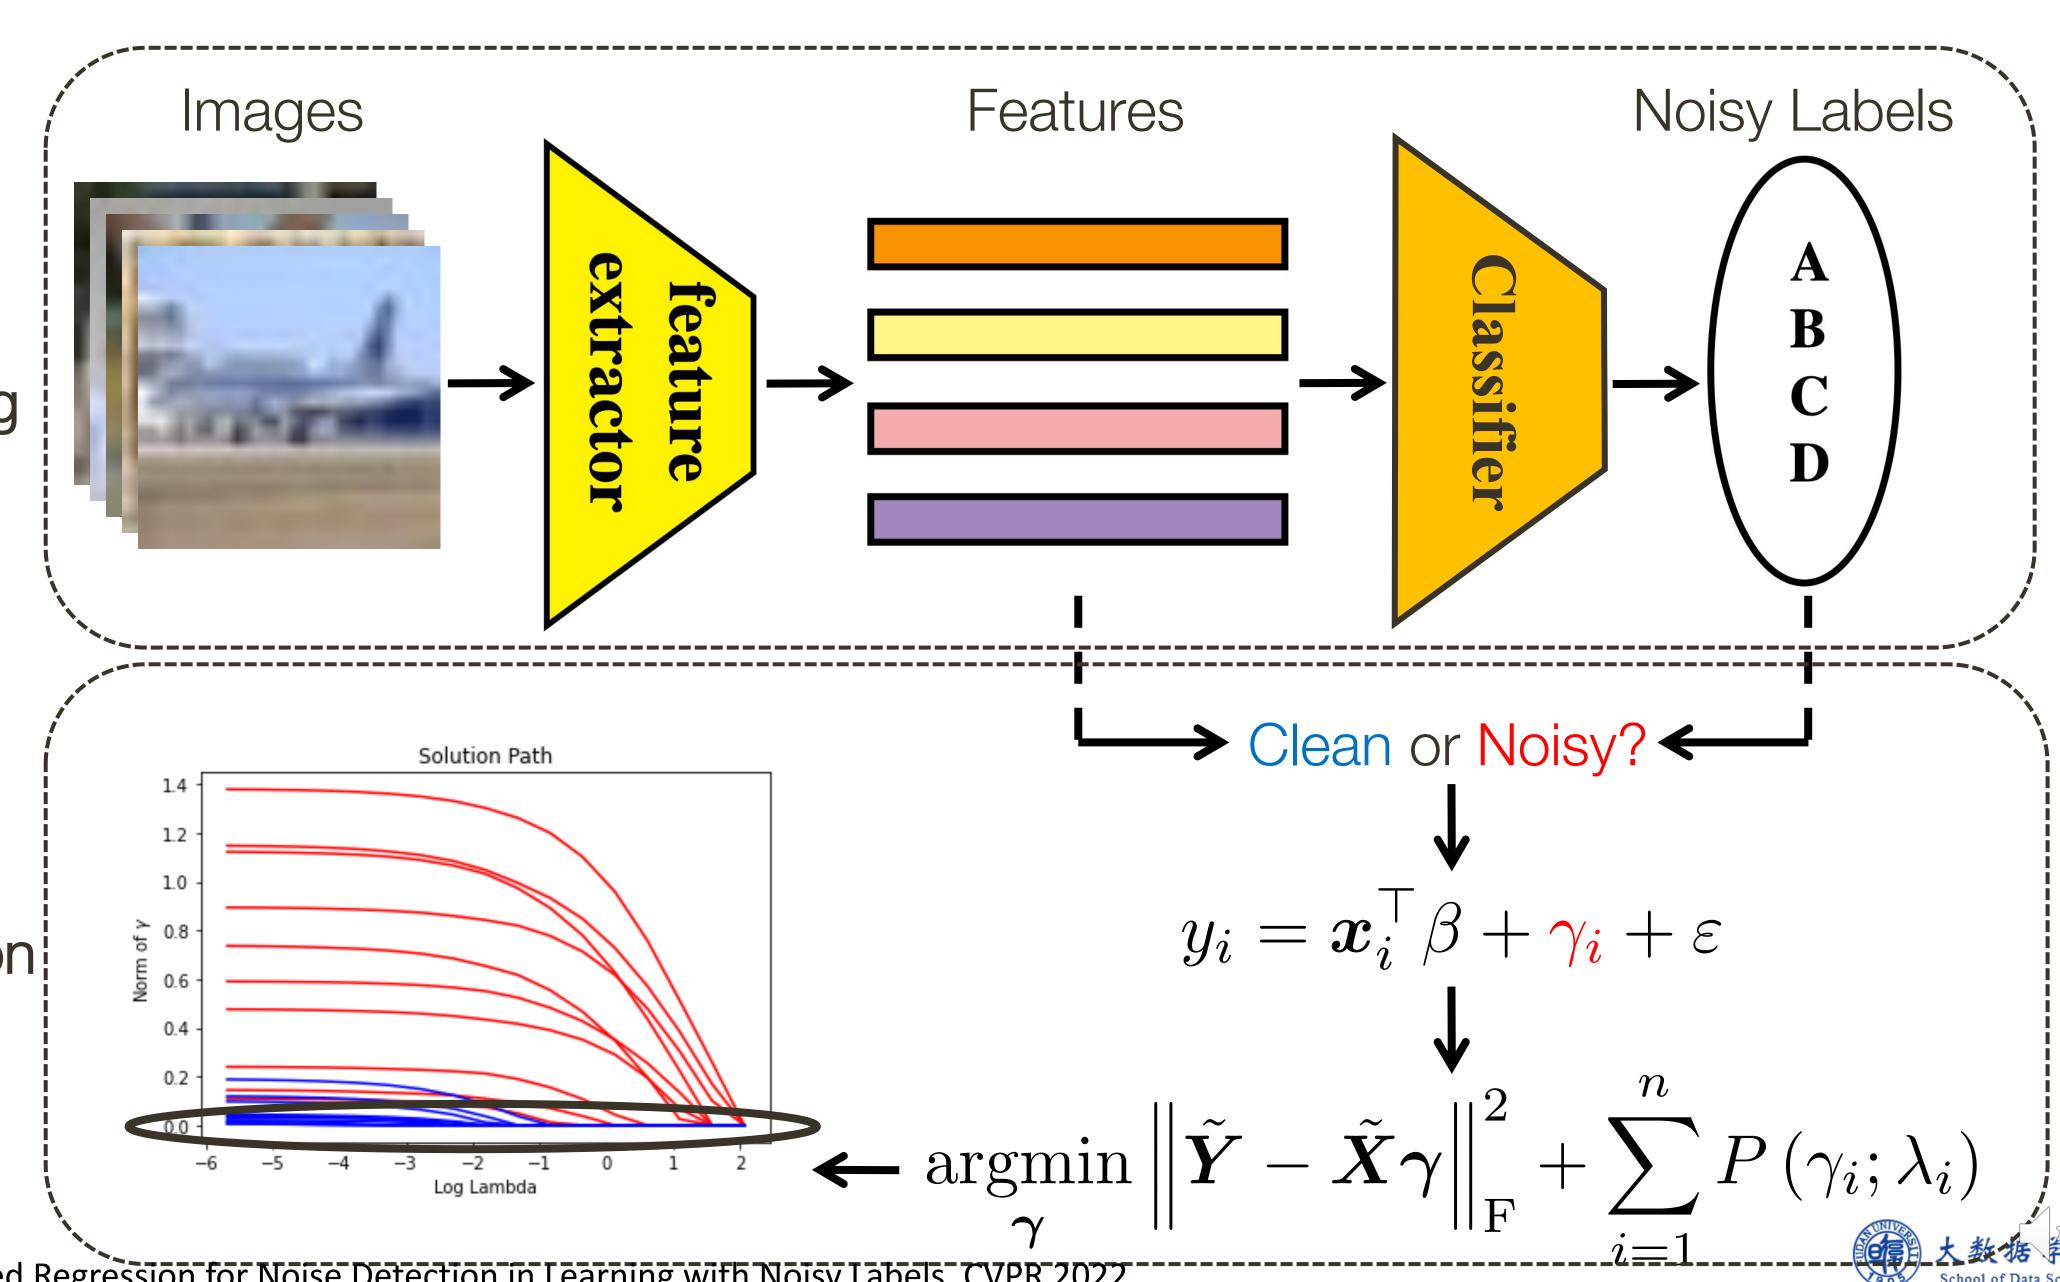

Framework

Stage 1: Feature Learning

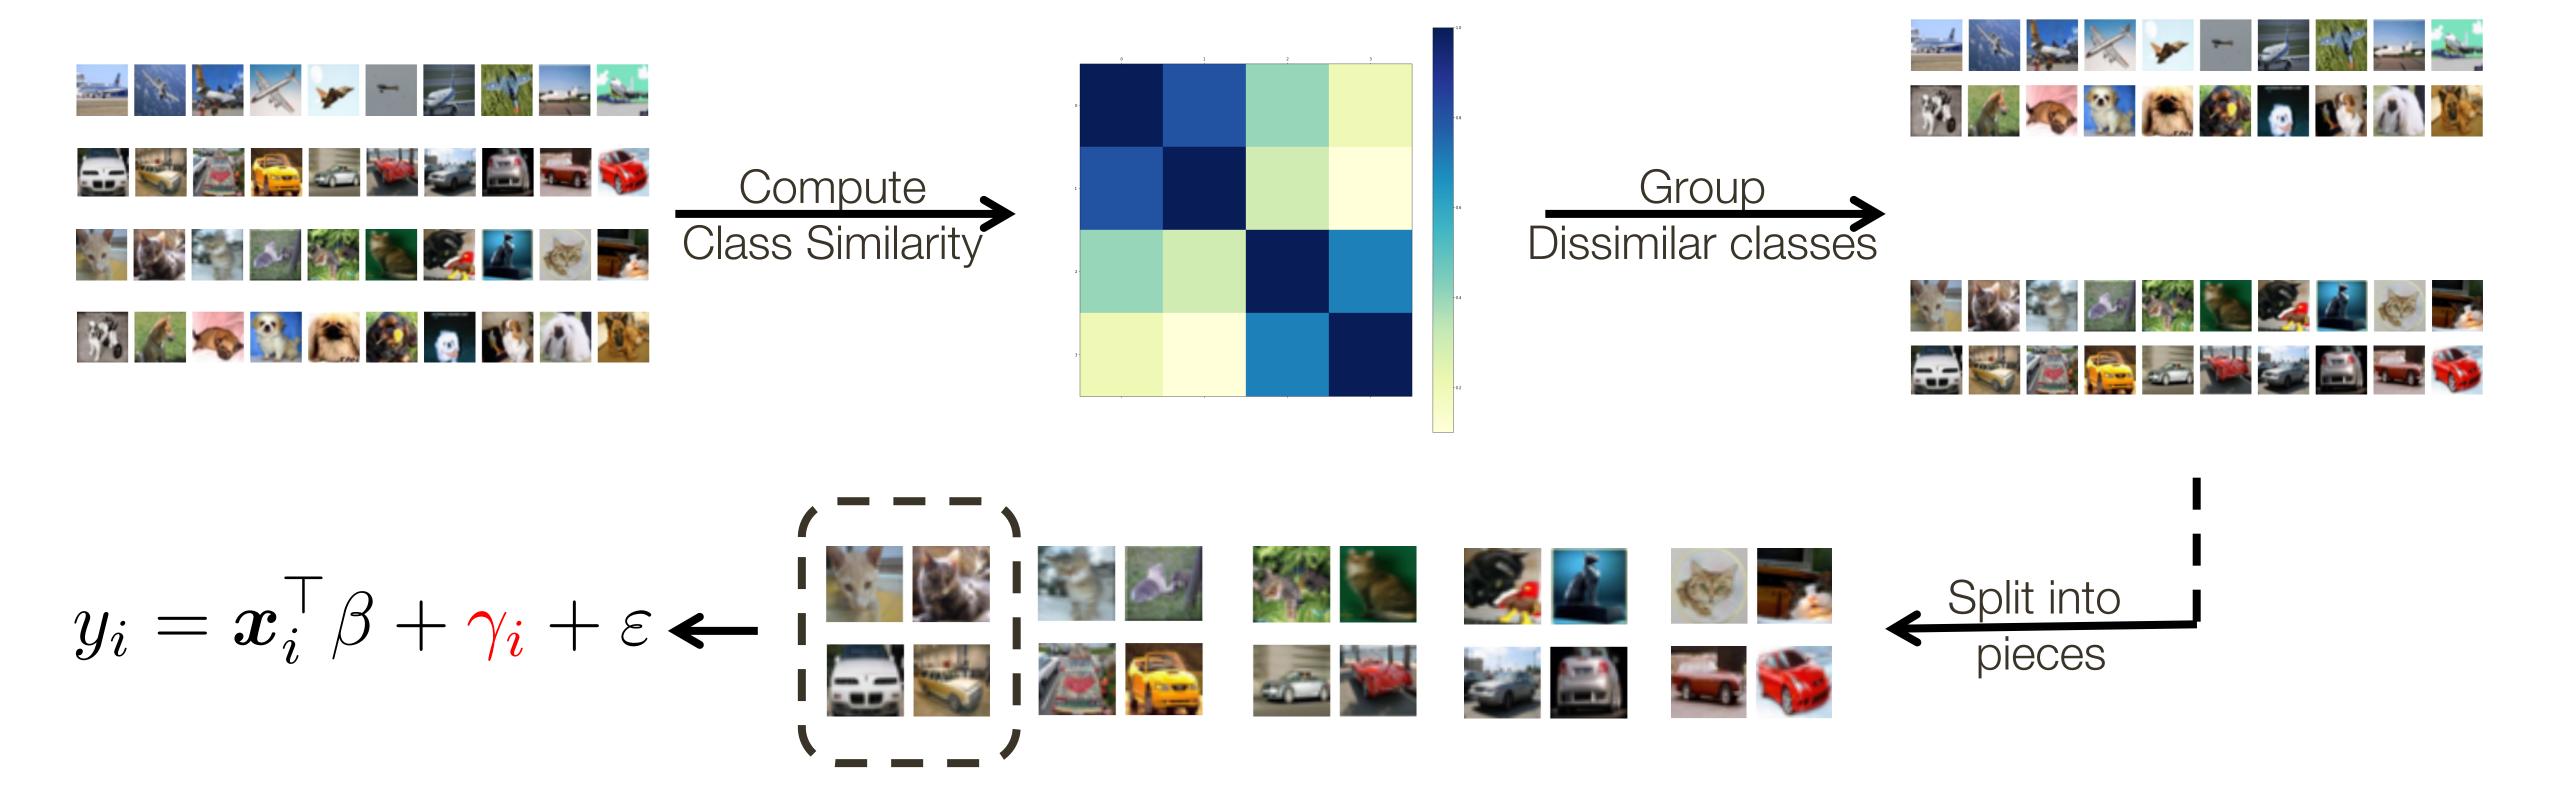

Stage 2: Sample Selection

Wang et al. Scalable Penalized Regression for Noise Detection in Learning with Noisy Labels. CVPR 2022.

Make it scalable to large datasets

Strategies to help train the network

• Append a $\ell_q(q < 1)$ penalty to encourage the linear relation between feature and one-hot encoded vector:

$$\mathcal{L}\left(oldsymbol{x}_{i},oldsymbol{y}_{i}
ight)=1_{i\notin O}\left(\mathcal{L}_{ ext{CE}}\left(oldsymbol{x}_{i},oldsymbol{y}_{i}
ight)+\lambda\left\|oldsymbol{x}_{i}^{ op}W_{ ext{fc}}
ight\|_{q}
ight)$$

• Use CutMix to further exploit the support of noisy data

$$\tilde{\boldsymbol{x}} = \boldsymbol{M} \odot \boldsymbol{x}_{\text{clean}} + (1 - \boldsymbol{M}) \odot \boldsymbol{x}_{\text{noisy}}$$

$$\tilde{\boldsymbol{y}} = \lambda \boldsymbol{y}_{\text{clean}} + (1 - \lambda) \boldsymbol{y}_{\text{noisy}}$$

Label precision performance
